

**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

1. (Currently Amended) 4) A Three-way three-way stopcock for medical use which comprises a body or nucleus (1) wherein a principal channel (2) and two secondary arms converge, so as to receive an intravenous catheter (11) and two other supply catheters (10, 10') respectively, acting in the body of the cited nucleus (1) a plug or stopper (4) which is externally activated by a handle (5) communicating or not the secondary arms (3, 3') and principal (2) arms between themselves, in which said secondary arms or channels (3, 3') emerge from the nucleus (1) in diametrically opposite 90° angles with respect to the principal arm (2), in such a way that the final portion of these secondary arms are oriented in the direction towards the head of the patient, characterized in that the secondary arms (3, 3') emerging from the nucleus (1) present, in each one of it's trajectories, initial portion or segment (3a, 3'a) which is curved, flexible and with a high elastic index continuing in a final distal segment (3b, 3'b) sensibly parallel between themselves, comprising:

a primary arm and two secondary arms meeting at a body, wherein the primary and secondary arms are configured and arranged to receive an intravenous catheter and two supply catheters, respectively; and

a plug disposed within the body, wherein the plug is configured and arranged for being externally activated by a handle;

wherein the principle arm and the secondary arms can be brought to selectively communicate with each other or be disconnected, and wherein the two secondary arms protrude diametrically opposite from the body, wherein the tangent of both arms nearest the body is perpendicular to the principal arm, wherein each secondary arm has (i) a proximal segment adjacent to the body that is curved and flexible, and (ii) a distal segment, wherein the two distal segments can be made essentially parallel and

the two proximal segments can be oriented in a direction perpendicular to the principal arm.

2. (Currently Amended) ~~2)~~~~Three-way~~ The three-way stopcock according to claim 1, characterized in that wherein the secondary arms (3, 3') are basically made out of material of medical grade polymer.

3. (Currently Amended) ~~3)~~~~Three-way~~ The three-way stopcock according to claim 1, characterized in that wherein the plug or stopper (4) presents in its interior inner channels (~~4a, 4b~~) which present an interior configuration sensibly in the form of inverted "V", with wherein the branches are slightly arched.
